

AI SHARK TANK — PITCH REPORT

25/6/2026, 8:17:40 pm

VerdeSpace Corporate Greens

Generated by the AI Shark Tank Simulator — entertainment & pitch-practice tool, not real investment advice.

The Pitch

Problem Statement:

Corporate offices lack natural greenery, which has been shown to reduce employee productivity and increase stress. However, maintaining indoor plants is operationally burdensome for office administration. Purchasing plants outright often leads to dead foliage due to inconsistent watering and poor care, resulting in wasted administrative budgets.

Solution:

We offer a managed indoor plant leasing service. We do not sell plants; instead, we lease them to corporate clients. Our in-house ground team visits the client's office twice a week to manually water, prune, and fertilize the plants. If a plant starts dying, we replace it at no extra cost, ensuring the office always looks premium.

Revenue Model:

A strict B2B retainer model. We charge a flat monthly subscription fee of Rs. 15,000 for maintaining 20 standard indoor plants. 70% of this revenue goes directly into our logistics (delivery vans, fuel) and manual labor costs (hiring local gardeners).

Target Audience:

Traditional corporate offices, law firms, and boutique real estate agencies strictly located within a 15-kilometer radius of our primary nursery in South Delhi.

Funding Ask:

₹30,00,000 for 20% equity

The Scorecard

Cross-Examination Transcript

Vikram Cross (The Venture Capitalist): Walk me through the market for Traditional corporate offices, law firms, and boutique real estate agencies strictly located within a 15-kilometer radius of our primary nursery in South Delhi. — is this a \$10M problem or a \$10B one?

You: Vikram, to be completely transparent, this is a geographically restricted, service-heavy lifestyle business, not a venture-scale rocket ship. Within a 15-kilometer radius of South Delhi, the addressable market for premium plant

leasing is closer to a few million dollars, making it a very small localized problem rather than a 10-billion-dollar one.

Because our model relies on manual labor and physical logistics to water and maintain these plants twice a week, expanding our geographic footprint requires heavy capital expenditure for new nurseries and delivery fleets. We are not aiming for 10x s

Mason Reyes (The Founder): If your co-founder quit tomorrow, could you still ship this alone?

You: Mason, I will be completely transparent. I am primarily the sales and vision person for VerdeSpace. My cofounder handles the entire logistical operation, including managing the delivery vans, sourcing the plants, and hiring the daily wage gardeners. We do not use any automated software to track our routes or watering schedules. It is all managed manually and heavily relies on my cofounder's personal relationships with the nursery staff. If they quit tomorrow, our daily operations would completely halt and I would absolutely not be able to fulfill our client contracts alone.

Priya Nandan (The Customer): Would I tell a friend about this, or just quietly stop using it after a week?

You: Priya, to be completely honest, this is not a viral product. It is a quiet administrative expense. Office managers might mention it to a peer if specifically asked, but no one is actively bragging about their office plants on social media. Furthermore, while they will not stop using it after a week because they are locked into an annual contract, we are usually the very first vendor they cut during a financial downturn. If a company needs to save money, they will cancel our plant maintenance service immediately and just switch to buying cheap artificial plastic plants.

Walter Sinclair (The Angel Investor): What does it cost you to acquire a customer, versus what that customer is worth to you?

You: Walter, to be completely frank, our unit economics are currently very poor. Because we rely on direct B2B sales and physical site visits to close deals, our Customer Acquisition Cost is extremely high. Meanwhile, our profit margins are exceptionally thin due to fuel costs, vehicle maintenance, and daily labor wages. It takes us nearly 14 months just to break even on a single corporate client. The lifetime value barely justifies the acquisition cost, which is exactly why we are burning cash and need this funding just to cover our basic operating expenses.

Vikram Cross (The Venture Capitalist): How does VerdeSpace Corporate Greens scale past your first wave of Traditional corporate offices, law firms, and boutique real estate agencies strictly located within a 15-kilometer radius of our primary nursery in South Delhi. without breaking?

You: I am not really sure how to scale this. I guess maybe we will just stay in South Delhi for a long time. I probably don't know how to expand or grow without breaking our operations. Hopefully we can figure it out later, but honestly, I have no idea how this becomes a big business.

Mason Reyes (The Founder): What's the single biggest execution risk for VerdeSpace Corporate Greens, and how are you mitigating it?

You: Mason, our single biggest execution risk is manual labor turnover and vehicle maintenance. Because we do not use software to route our vans or track watering schedules, our operations are fragile and managed entirely on Excel. If our head gardener leaves, operations halt. We are not mitigating this with technology, as we lack the budget; we are simply hoping to retain staff through informal relationships.

Priya Nandan (The Customer): Walk me through the first five minutes of actually using VerdeSpace Corporate Greens — what do I feel?

You: Priya, during the first five minutes, you likely feel a mix of skepticism and relief. You see our team arrive in a standard delivery van, looking like typical maintenance staff rather than a premium tech-enabled experience. You feel a sense of relief that the dead foliage you've been staring at is finally being removed, but there is no app interface or automated tracking for you to engage with it is a purely manual, low-tech process where you just hand over the keys to the office utility closet. You do not feel like a tech-adopter, but rather like an administrator who has successfully outsourc

Walter Sinclair (The Angel Investor): For a ₹30,00,000 for 20% equity ask, what's the exit?

You: Walter, if I am being completely transparent, there is no high-multiple exit strategy here like you would expect from a tech startup. We are a low-margin service business, not a scalable platform. Your realistic return is essentially a modest share of our annual cash flow after we pay for our fuel, van maintenance, and gardener wages. We do not have a plan for an acquisition or an IPO, so your "exit" is likely limited to dividend payments if we manage to maintain our 20 client base in South Delhi without our costs spiraling out of control.

The Verdict

INVESTED!

VerdeSpace Corporate Greens cleared the bar at 76/100. It's not a perfect pitch, but the fundamentals are strong enough that the panel wants in: ₹30 L for 20% equity, valuing the

Suggested Valuation: ₹11.50 Cr

Funding Amount: ₹30 L | Equity: 20%

Final Word From The Panel

Vikram Cross:

68/100. Real, but I'd want to see it double before I lead a round.

Mason Reyes:

81/100 on execution. That's founder energy I'd back.

Priya Nandan:

Innovation landed at 61/100. It's fine, I just wouldn't go out of my way for it.

Walter Sinclair:

90/100 on the model. I can see my return from here.
